

CS 161A: Programming and Problem Solving I

Assignment A04 Sample Algorithmic Design Document

Make a copy before you begin (File -> Make a copy). Add the Assignment # above and complete the sections below BEFORE you begin to code. The sections will expand as you type. When you are finished, download this document as a PDF (File -> Download -> PDF) and submit to D2L.

This document contains an interactive checklist. To mark an item as complete, click on the box (the entire list will be highlighted), then right click (the clicked box will only be highlighted), and choose the checkmark.

Planning your program before you start coding is part of the development process. In this document you will:

- ☐ Paste a screenshot of your zyBooks Challenge and Participation %
- ☐ Paste a screenshot of your assigned zyLabs completion
- ☐ Write a detailed description of your program, at least two complete sentences
- ☐ If applicable, design a sample run with test input and output
- ☐ Identify the program inputs and their data types
- ☐ Identify the program outputs and their data types
- ☐ Identify any calculations or formulas needed
- ☐ Write the algorithmic steps as pseudocode or a flowchart
- ☐ Tools for flowchart - [Draw.io](#) - [Diagrams.net](#)

1. zyBooks

Add your zyBooks screenshots for the % and assigned zyLabs completions below. Required percentages: all **assigned** zyLabs, Challenge Activity with at least 70%, and Participation Activity with at least 80%.

Challenge and Participation % screenshot:

Table of contents	zyLabs	Challenge	Participation
11. CS 161B: Arrays	100%	84%	100%
11.1 Arrays	77%	100%	
11.2 Iterating through arrays	85%	100%	
11.3 Multiple arrays	100%	100%	
11.4 Loop-modifying or copying/comparing arrays	100%	100%	
11.5 Functions with array parameters	66%	100%	
11.6 Functions with array parameters: Common errors		100%	
11.7 Debugging example: Reversing an array		100%	
11.8 Shifting Values in an Array		100%	
11.9 Video Tutorials on Array applications		No activities	
11.10 Assignment Sample		No activities	

Assigned zyLabs completion screenshot:

The screenshot shows the zyBooks interface for the course CS 161B: Programming II. The top navigation bar includes the zyBooks logo, the course title, and a search bar. The main content area displays a table of contents for the course, with a sidebar on the right showing the completion status of various labs. The labs are listed with their titles, completion percentages, and a 'Print chapter' button. The completion status is shown as a green bar with a percentage and a dropdown arrow. The labs are:

Lab Title	Completion Status
11.7 Debugging example: Reversing an array	100%
11.8 Shifting Values in an Array	100%
11.9 Video Tutorials on Array applications	No activities
11.10 Assignment Sample	No activities
11.11 LAB: Insert Values into an array	100%
11.12 LAB: Remove Values from an array	100%
11.13 LAB: Adjust array by normalizing - functions	100%
11.14 LAB: Output numbers in reverse (Optional)	0%
11.15 C++ LAB: Output values below an amount (Optional)	0%
11.16 LAB: Even/odd values in an array (Optional)	0%
12. CS 161B: Char Arrays	0% 0% 27%

The right sidebar shows the course title 'CS 161B: Programming II' and the expiration date 'Expires Jul 3rd, 2022'. It also includes a 'View my activity' section with a date and time selector (May 10th, 2022, 11:59 pm PDT) and a 'Download' button. At the bottom, there are buttons for 'My activity', 'My subscription', and 'Assignments'.

2. Program Description

In the box below, describe the purpose of the program. You must include a detailed description with at least two complete sentences.

Program description:

In this assignment, you will be writing a function that will remove all occurrences of one or more numbers by shifting the values in the array.

3. Sample Run

If you are designing your own program, you will start with a sample run. Imagine a user is running your program - what will they see? What inputs do you expect, and what will be the outputs from the given inputs? Choose test data you will use to test your program. Calculate and show the expected outputs. Use the sample run to test your program.

Sample run:

```
int a1[] = {42, 3, 9, 42, 42, 0, 42, 9, 42, 42, 17, 8, 2222,
4, 9, 0, 1};
int a2[] = {42, 2222, 9};

banish(a1, 17, a2, 3);
3, 0, 17, 8, 4, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0
```

4. Algorithmic Design

Before you begin coding, **you must first plan out the logic** and think about what data you will use to test your program for correctness. All programmers plan before coding - this saves a lot of time and frustration! Use the steps below to identify the inputs and outputs, calculations, and steps needed to solve the problem.

Algorithmic design:

a. Identify and list all of the user input and their data types.

- None

b. Identify and list all of the user output and their data types.

- Old array as a list of number
- New array as list of number

c. What calculations do you need to do to transform inputs into outputs? List all formulas needed, if applicable. If there are no calculations needed, state there are no calculations for this algorithm.

- None

d. Design the logic of your program using pseudocode or flowcharts. Here is where you would use conditionals, loops or functions (if applicable) and list the steps in transforming inputs into outputs. Walk through your logic steps with the test data from the assignment document or the sample run above.

1. FUNCTION printOld(int list[], int size)

- a. **FOR LOOP** from i = 0 to i less than size
 - i. **DISPLAY** each element in the array
- b. **END FOR LOOP**

END FUNCTION printOldt()

2. FUNCTION printNewt(int list[], int size)

- a. **FOR LOOP** from i = 0 to i less than count
 - i. **DISPLAY** each element in the array
- b. **END FOR LOOP**

END FUNCTION printList()

3. FUNCTION banish(int list[], int size)

- a. **DECLARE** Position hold the index of the number to be deleted.
- b. **FOR LOOP** from i = 0 till count
 - i. **IF** element is even **THEN**
 - 1. **SET** position to i
 - 2. **CALL** the deleteNum function and send list, size and Position to it.
 - 3. **SET** i to i–, so we check the next value.
 - ii. **END IF**
- c. **END FOR LOOP**

END FUNCTION banish()

4. FUNCTION deleteNum(int list[], int size, int Position)

- a. **FOR LOOP** from i = Position till size
 - i. **SET** list[i] to list[i+1] (copy element from i+1 position to i)
- b. **END FOR**
- c. **SET** count to size-1

END FUNCTION deleteNum()

5. FUNCTION main()

- a. **DECLARE** list a1 as integer array
- b. **DECLARE** list a2 as integer array
- c. **SET** list a1 to given values
- d. **SET** list a2 to banish values
- e. **CALL** printOld to print the original list
- f. **CALL** banish to get rid of numbers
- g. **CALL** printNew to print the new list
- h. **DISPLAY** Thank you message.

END FUNCTION main()

5. Pseudocode Syntax

Think about each step in your algorithm as an action and use the verbs below:

To do this:	Use this verb:	Example:
Create a variable	DECLARE	DECLARE integer num_dogs
Print to the console window	DISPLAY	DISPLAY "Hello!"
Read input from the user into a variable	INPUT	INPUT num_dogs
Update the contents of a variable	SET	SET num_dogs = num_dogs + 1
Conditionals		
Use a single alternative conditional	IF <i>condition</i> THEN <i>statement</i> <i>statement</i> END IF	IF num_dogs > 10 THEN DISPLAY "That is a lot of dogs!" END IF
Use a dual alternative conditional	IF <i>condition</i> THEN <i>statement</i> <i>statement</i> ELSE <i>statement</i> <i>statement</i> END IF	IF num_dogs > 10 THEN DISPLAY "You have more than 10 dogs!" ELSE DISPLAY "You have ten or fewer dogs!" END IF
Use a switch/case statement	SELECT <i>variable or expression</i> CASE <i>value_1</i> : <i>statement</i> <i>statement</i> CASE <i>value_2</i> : <i>statement</i> <i>statement</i> CASE <i>value_2</i> : <i>statement</i> <i>statement</i> DEFAULT: <i>statement</i> <i>statement</i> END SELECT	SELECT num_dogs CASE 0: DISPLAY "No dogs!" CASE 1: DISPLAY "One dog.." CASE 2: DISPLAY "Two dogs.." CASE 3: DISPLAY "Three dogs.." DEFAULT: DISPLAY "Lots of dogs!" END SELECT
Loops		
Loop while a condition is true - the loop body will	WHILE <i>condition</i> <i>statement</i>	SET num_dogs = 1 WHILE num_dogs < 10

execute 0 or more times.	<i>statement</i> END WHILE	DISPLAY num_dogs, " dogs!" SET num_dogs = num_dogs + 1 END WHILE
Loop while a condition is true - the loop body will execute 1 or more times.	DO <i>statement</i> <i>statement</i> WHILE <i>condition</i>	SET num_dogs = 1 DO DISPLAY num_dogs, " dogs!" SET num_dogs = num_dogs + 1 WHILE num_dogs < 10
Loop a specific number of times.	FOR <i>counter</i> = <i>start</i> TO <i>end</i> <i>statement</i> <i>statement</i> END FOR	FOR count = 1 TO 10 DISPLAY num_dogs, " dogs!" END FOR
Functions		
Create a function	FUNCTION <i>return_type</i> <i>name (parameters)</i> <i>statement</i> <i>statement</i> END FUNCTION	FUNCTION Integer add(Integer num1, Integer num2) DECLARE Integer sum SET sum = num1 + num2 RETURN sum END FUNCTION
Call a function	CALL <i>function_name</i>	CALL add(2, 3)
Return data from a function	RETURN <i>value</i>	RETURN 2 + 3
